Question E.

Computer - is a truly genius invention that is still developing and updating it's technical and logical characteristics to this day. The rise of technological progress is becoming so dramatically fast, that it resulted in another invention that is tightly tied to the computer - Artificial intelligence.

Since 2024, I use it to this day due to it's usefulness and a great ability to help me in my daily-life questions and problems. It has a huge influence on my daily routine, and it even came to the point where I cannot

live a single day without it. Basically it's a robot that has a very strong "mind" and wonderful intelligence in almost every aspect: from daily-like household questions, to the heavy and complex mathematical operations. A nice "companion" that can help you anytime and anywhere.

But let's not forget about the side effects, sure it has a lot of advantages and there are more of them, neither disadvantages but let's keep it honest. It is already known to be very helpful as I stated above, but here are the some of disadvantages:

1. Users cannot think or solve problems without it again.
2. Sometimes it can give invalid results, that may lead to a huge problem
3. Users being too naive and trusting AI too much.

If coming to the conclusion, AI definitely is a great thing, but as it's always known, you should not over-use it. To be honest I haven't experienced any problems with it, but still, I do not recommend using it everytime because people should also think by themselves.
